

## Review Exercise Set 26

Exercise 1: Find the complementary and supplementary angles of a  $35^\circ$  angle.

Exercise 2: Given that  $m(\overline{AB}) = 5\text{ cm}$ ,  $m(\overline{CD}) = 3\text{ cm}$ , and  $m(\overline{AD}) = 12\text{ cm}$ , find  $m(\overline{BC})$ .

Exercise 3: Find the measurement of angle "x",  $m(\angle x)$ .

Exercise 4: Find the value of  $x$ .

Exercise 5: Given that lines  $l$  and  $m$  are parallel, find  $x$  and  $y$ .

Exercise 6: Given that  $m(\angle y) = 95^\circ$  and  $m(\angle y) = 24^\circ$ , find the measurements of angles a, b, and x.

## Review Exercise Set 26 Answer Key

Exercise 1: Find the complementary and supplementary angles of a  $35^\circ$  angle.

Complementary angles must add up to equal  $90^\circ$ .

Let  $x$  = the unknown angle.

$$x + 35^\circ = 90^\circ$$

$$x = 90^\circ - 35^\circ$$

$$x = 55^\circ$$

**The complementary angle to  $35^\circ$  is  $55^\circ$ .**

Supplementary angles must add up to equal  $180^\circ$ .

Let  $x$  = the unknown angle.

$$x + 35^\circ = 180^\circ$$

$$x = 180^\circ - 35^\circ$$

$$x = 145^\circ$$

**The supplementary angle to  $35^\circ$  is  $145^\circ$ .**

Exercise 2: Given that  $m(\overline{AB}) = 5 \text{ cm}$ ,  $m(\overline{CD}) = 3 \text{ cm}$ , and  $m(\overline{AD}) = 12 \text{ cm}$ , find  $m(\overline{BC})$ .

The sum of the three line segments  $m(\overline{AB})$ ,  $m(\overline{BC})$ , and  $m(\overline{CD})$  must equal the length of the line segment  $m(\overline{AD})$

Let  $x$  = the length of the unknown line segment  $m(\overline{BC})$

$$m(\overline{AB}) + m(\overline{BC}) + m(\overline{CD}) = m(\overline{AD})$$

$$5 \text{ cm} + x + 3 \text{ cm} = 12 \text{ cm}$$

$$x + 8 \text{ cm} = 12 \text{ cm}$$

$$x = 12 \text{ cm} - 8 \text{ cm}$$

$$x = 4 \text{ cm}$$

Exercise 3: Find the measurement of angle "x",  $m(\angle x)$ .

We know from the picture that the sum of the two angles is equal to  $126^\circ$ , so we can setup our equation as:

$$\begin{aligned}x + 42^\circ &= 126^\circ \\x &= 126^\circ - 42^\circ \\x &= \mathbf{84^\circ}\end{aligned}$$

Exercise 4: Find the value of x.

$x$  and  $x + 25^\circ$  are supplementary angles so their sum must equal  $180^\circ$

$$\begin{aligned}x + x + 25^\circ &= 180^\circ \\2x + 25^\circ &= 180^\circ \\2x &= 180^\circ - 25^\circ \\2x &= 155^\circ \\x &= 155^\circ \div 2 \\x &= \mathbf{77.5^\circ}\end{aligned}$$

Exercise 5: Given that lines  $l$  and  $m$  are parallel, find  $x$  and  $y$ .

$2x$  and  $y$  are alternating interior angles so their measurements must be the same.

$$2x = y$$

$y$  and  $2x + 40^\circ$  are supplementary angles so their sum must equal  $180^\circ$ .

$$y + 2x + 40^\circ = 180^\circ$$

Since we know from our first equation that  $2x = y$ , we can substitute the  $2x$  in for  $y$  in the second equation. This will reduce the equation down to having only one unknown variable.

$$y + 2x + 40^\circ = 180^\circ$$

$$2x + 2x + 40^\circ = 180^\circ$$

$$4x + 40^\circ = 180^\circ$$

$$4x = 180^\circ - 40^\circ$$

$$4x = 140^\circ$$

$$x = 140^\circ \div 4$$

$$x = 35^\circ$$

Exercise 6: Given that  $m(\angle y) = 95^\circ$  and  $m(\angle y) = 24^\circ$ , find the measurements of angles a, b, and x.

Angles a and y are supplementary angles so their sum is  $180^\circ$

$$\begin{aligned} a + y &= 180^\circ \\ a + 95^\circ &= 180^\circ \\ a &= 180^\circ - 95^\circ \\ \mathbf{a} &= \mathbf{85^\circ} \end{aligned}$$

Angles a, b, and c are the interior angles of a triangle, formed by the intersection of the three lines, so their sum must equal  $180^\circ$ . We know angles a and c so we can substitute in their measurements and solve for b.

$$\begin{aligned} a + b + c &= 180^\circ \\ 85^\circ + b + 24^\circ &= 180^\circ \\ b + 109^\circ &= 180^\circ \\ b &= 180^\circ - 109^\circ \\ \mathbf{b} &= \mathbf{71^\circ} \end{aligned}$$

Angles x and b are vertical angles so their measurements must be the same.

$$\begin{aligned} x &= b \\ \mathbf{x} &= \mathbf{71^\circ} \end{aligned}$$
